DETAILED ACTION

Allowable Subject Matter

Claims 22-26 are allowed.

The closest prior art to the instant invention is Kelly et al. (U.S. Patent No. 2,503,951). Kelly et al. teaches in Figure 5, a tool body (23) for a rotatable cutting tool having at least one recess (24) with a first and second opposing walls for releasably retaining a replaceable insert (25 with exposed cutting edge), an isolating channel/slot (17) spaced from the recess to define an elastically deformable leaf there between, wherein the first wall of the recess is formed by the leaf. Kelly et al. also teaches a tapered pin (leaf bending element) (19) adjustable within the isolating channel for elastically bending the leaf from a relaxed position to a clamping position wherein the first wall clamps the insert against the second wall. Furthermore, Kelly et al. teaches in Figure 5, first wall that is inclined at a shallow angle relative to the second wall and when the leaf is in the relaxed position, the first wall diverges from the second wall in a direction away from an open end of the recess ('951, Col. 3, lines 45-56).

However, regarding independent claim 22, Kelly et al. fails to anticipate or make obvious the isolation channel being inclined at a shallow angle to approach the recess in a direction away from an open end of the isolation channel. Regarding independent claims 22 and 26, Kelly et al. fails to anticipate or make obvious to provide the tapered hole (18) with an internal thread for receiving a tapered threaded screw (and for the isolation channel to straddle the threaded hole). It should be noted that there is not

enough room at the end of the tapered pin (19) to accommodate a threaded hole for receiving a taper headed screw, in Kelly et al.'s tool (such as the one shown in Hunter, USP 867,275, figure 6).
